PDG Database Access with Python

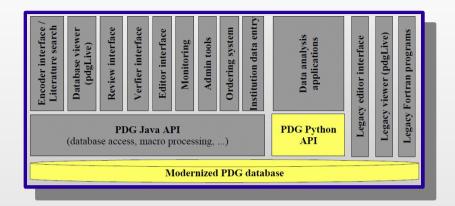

- **We will use the PDG Python API in order to interactively:**

  1. Open a connection to the PDG database

  2. Retrieve the datablock containing the information about top mass measurements

  3. Print the datablock

  4. Use ROOT to draw a histogram of the top mass measurements included into the PDG evaluation of the top mass

> **With the new PDG Python API user programs could, for the first time, easily access the PDG database. This will allow a completely new level of access to PDG data, and will open up a whole new world of applications.**
